Project Overview
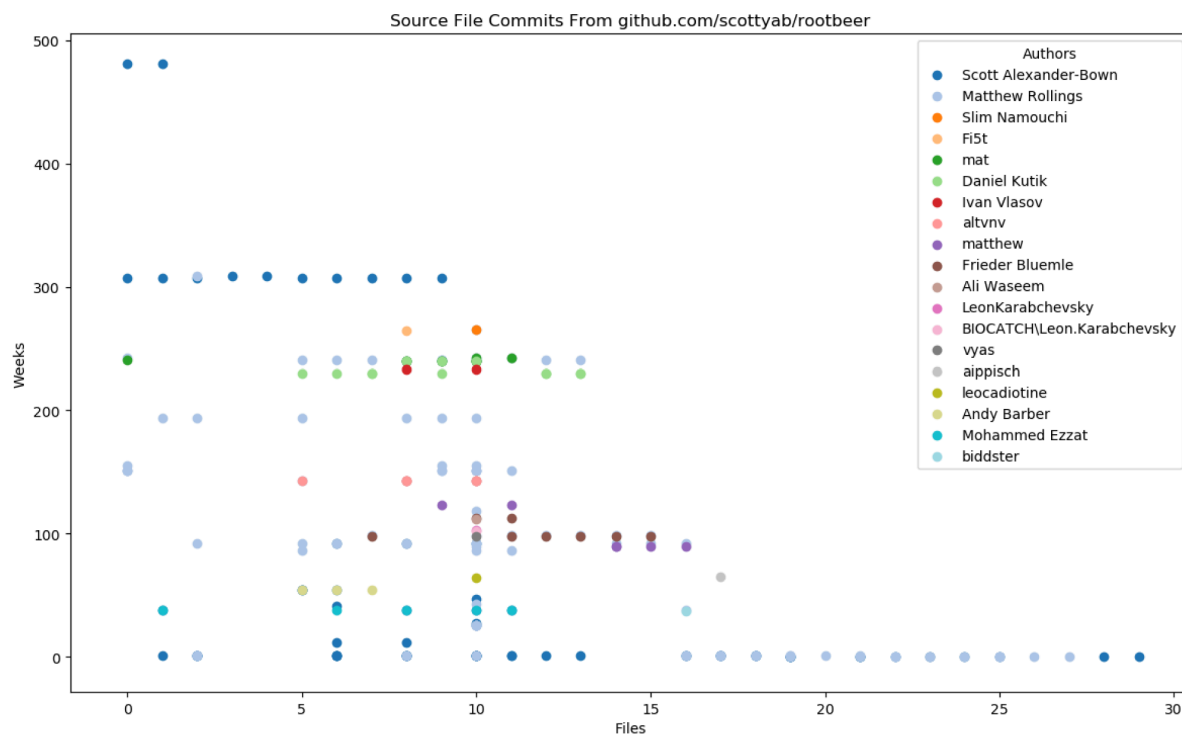

RootBeer was started in 2015 by Scott and Matt as a small project. The project has grown to over 30 contributors and has seen steady updates and changes until 2021, when progress altogether came to a halt. I have filtered source files in the project's repository to visualize the current state of things. Below is a clear visual of the abrupt end to the commit history, marking the end of progress on RootBeer. As this is an important project for our company, I would like to see a revival in the progress of this project.

Attention Needed

While progress has been scarce in the last three years, issue reports on the project's GitHub have piled up, citing many different issues and bugs. It appears that our two biggest contributors, Scott and Matt, have turned their attention to other projects. I suggest hiring a developer or two, possibly a previous contributor that is familiar with the project, like Daniel Kutik.

There is work to be done on RootBeer and issue reports that remain unresolved reflect poorly on our company's commitment to agile program development. I suggest allocating resources to continue work on RootBeer so that we can start resolving known issues and let our customers know that we are actively addressing their concerns.
