# Executive Summary

Date: 01/30/2025
Prepared by: Parham Pahlavan

About the project:

Rootbeer is a project developed to reverse engineer Android applications. It helps in decompiling Android APK files to be able to analyze their source code. Transforming and simplifying the app's bytecode is the main process in this.

Overview of the plot developed in part 2:

For this assignment, I only counted .py files as source files, since for now the only language of our project is Python.

The git commands I learned to use in this assignment were the git branch and git checkout commands. They allowed me to create and enter new branches, which is an essential part of the source control process.
